DNA fingerprinting in plants is used for protection of the ecosystem, identification of marker traits, gene diversity and variation, and mutations. There are various methods for plant DNA fingerprinting like Restriction Fragment Length Polymorphisms (RFLPs), Randomly Amplified Polymorphic DNAs (RAPDs), Amplified Fragment Length Polymorphism (AFLP), and Simple Sequence Repeats (SSRs).

Breeders conventionally use the phenotype to evaluate the genotype of a plant or an animal. As it is difficult to make out homozygous or heterozygous dominance from appearance, the DNA fingerprinting allows a fastidious and precise determination of genotype. It is basically useful in breeding race horses and hunting dogs.
