For many years, there has been a great deal of work done on chronic congestive heart failure while acute heart failure has been considered a difficult to handle and hopeless syndrome. However, in recent years acute heart failure has become a growing area of study and this is the first book to cover extensively the diagnosis and management of this complex condition. The book reflects the considerable amounts of new data reported and many new concepts which have been proposed in the last 3-4 years looking at the epidemiology, diagnostic and treatment of acute heart failure.

The number of people suffering from this debilitating condition is predicted to grow exponentially over the next decade. This has serious implications for the health services. Investigating heart failure is not cheap even where facilities exist. The drugs used, though effective – often remarkably so – are also costly as are laboratory investigations. These again are not cheap. People with heart failure require frequent admissions to hospital and occupy many beds and much staff attention. All of these factors are set to increase over the next decades. This eclectic collection of papers tackles many of the issues that concern those who care for individuals with heart failure; organisation of services, exercise, palliative care amongst them, but also novel and rarely discussed issues. The book is suited to both pre and post-registered health care students. We do not supply inspection copies but we do supply Examination copies, whereby a course leader has 30 days to evaluate the book, then choose to adopt, purchase or return the book. The development of the Chronic Care Model (CCM) for the care of patients with chronic diseases has focused on the integration of taking charge of the patient and his family within primary care. The major critical issues in the implementation of the CCM principles are the non-application of the best practices, defined by EBM guidelines, the lack of care coordination and active follow-up of clinical outcomes, and by inadequately trained patients, who are unable to manage their illnesses. This book focuses on these points: the value of an integrated approach to some chronic conditions, the value of the care coordination across the continuum of the illness, the importance of an evidence-based management, and the enormous value of the patients involvement in the struggle against their conditions, without forgetting the essential role of the caregivers and the community when the diseases become profoundly disabling.

"We do not have to choose" between science and spirituality in our work as providers of healthcare, Larrabee assures the biomedical community. A thoughtful integration of both aspects of shared humanity could make for better clinicians, more satisfied patients, and greater ease in navigating daily life. Backed by research, personal vignettes and the cumulative experience of over 40 years of nursing experience and heart failure management, Larrabee invites readers to reclaim their own sacred hearts, using wisdom and compassion as a guide to fully integrated living. Written from the perspective of advanced heart failure management, this invitation to integrated, devotional living is open and accessible to everyone, regardless of occupation or spiritual beliefs.

Heart failure is a devastating syndrome that will affect one in every three adults in the United States. Heart failure management is costly and patients diagnosed with heart failure use a disproportionately high percentage of healthcare dollars. The management of heart failure patients is time consuming and complex. Nurse practitioners are well suited to provide quality care to this population of patients and through aggressive management and education keep hospital patients from multiple readmissions.
