Intravascular Ultrasound Imaging–Guided Versus Coronary ...

Intravascular imaging—intravascular ultrasound and more recently optical coherence tomography—provide a tomographical or cross-sectional image of the coronary arteries.

Intravascular imaging in coronary artery disease - The Lancet

Coronary intravascular ultrasound has been used to evaluate the placement of stents and to identify the presence of a dissection or plaque in cardiac vasculature (Guo et al., 2010; Johnson, Patel, Yeung, & Kaul, 2014; Mintz, 2014). Although this

technique is not currently used intracerebrally, the development of smaller delivery catheters may allow for applications during cerebral angiography.

In contrast, greyscale intravascular ultrasound can fully assess the extension of the disease axially and longitudinally. This intravascular imaging technique has played a vital role in advancing our understanding of the pathophysiology of coronary artery disease, and in the development of novel cardiovascular drugs and device therapies.

is a catheter-based coronary imaging technique. It utilises the emission & subsequent detection of reflected high frequency (30–60 MHz) sound waves to create high resolution, cross-sectional images of the coronary artery.

The role of intravascular ultrasound in percutaneous ...

Intracoronary imaging has the capability of accurately measuring vessel and stenosis dimensions, assessing vessel integrity, characterising lesion morphology and guiding optimal percutaneous coronary intervention (PCI). Coronary angiography used to detect and assess coronary stenosis severity has limitations.

Since IVUS is configured to be a mandatory step of an already complex and potentially risky procedure such as LMCA PCI, it is desirable that its application is easy and user-friendly.

With the advent of novel ancillary technologies, such as intravascular ultrasound (IVUS) and optical coherence tomography (OCT), it has become imperative that routine upfront intravascular imaging be incorporated in PCI procedures to improve efficiency and achieve superior clinical outcomes.

Role of Intravascular Ultrasound in Guiding Complex ...

Intravascular Ultrasound (or IVUS) allows us to see a coronary artery from the inside-out. This unique point-of-view picture, generated in real time, yields information that goes beyond what is possible with routine imaging methods, such as coronary angiography, performed in the cath lab, or even non-invasive Multislice CT scans.

Intravascular Ultrasound (IVUS) - PTCA

Intravascular ultrasound is a medical imaging methodology using a specially designed catheter with a miniaturized ultrasound probe attached to the distal end of the catheter. The proximal end of the catheter is attached to computerized ultrasound equipment. It allows the application of ultrasound technology, such

NIRS imaging of non-obstructive territories in patients undergoing cardiac catheterisation and possible percutaneous coronary intervention was safe and can aid in identifying patients and segments at higher risk for subsequent NC-MACE. NIRS-intravascular ultrasound imaging adds to the armamentarium as the first diagnostic tool able to detect vulnerable patients and plaques in clinical practice.

IVUS is performed during cardiac
catheterisation using miniature ultrasound
probes mounted on the tip of a coronary
catheter. The IVUS probe emits high
ultrasound frequencies, typically centred
at 20–50 MHz. The ultrasound signal
reflected from arterial wall structures is
used to generate a grey scale image.

Intravascular ultrasound (IVUS) and intravascular optical coherence tomography (IVOCT) are widely utilized clinical imaging modalities employed for the diagnosis and treatment of coronary artery and peripheral vascular disease.
