The theory of optimal control is concerned with operating a dynamic system at minimum cost. The case where the system dynamics are described by a set of linear differential equations and the cost is described by a quadratic function is called the LQ problem. One of the main results in the theory is that the solution is provided by the linear-quadratic regulator, a feedback controller whose equations are given below. The LQR is an important part of the solution to the LQG problem. Like the ...

The Principle of Optimality is a major intuitive aid in understanding optimal control. Problem 2.2-1 • Consider a system of the form $\dot{x} = f(x) + gu$ with performance index $V(x(t), u(\cdot)) = \int_0^T \{u^2 + h(x)\} dt$ Show that the Hamilton-Jacobi equation is linear in dV/dt and quadratic in dV/dx . Problem 2.2-2.

Linear-Quadratic Optimal Control in Maximal Coordinates Jan Bru'digam, Zachary Manchester Abstract—The Linear-quadratic regulator (LQR) is an efficient control method for linear and linearized systems. Typically, LQR is implemented in minimal coordinates (also called generalized or “joint” coordinates). However, recent research suggests that

Optimal control is an extension of the calculus of variations, and is a mathematical optimization method for deriving control policies. The method is largely due to the work of Lev Pontryagin and Richard Bellman in the 1950s, after contributions to calculus of variations by Edward J. McShane.

A linear-quadratic (LQ, for short) optimal control problem is considered for mean-field stochastic differential equations with constant coefficients in an infinite horizon. The stabilizability of the control system is studied followed by the discussion of the well-posedness of the LQ problem.

Linear controllers are achieved by working with quadratic performance indices. These are quadratic in the control and regulation/tracking error variables. Such methods that achieve linear optimal control are termed LinearQuadratic (LQ) methods. Of course, one may well ask: why linear optimal control, as opposed simply to optimal control?
