Pandora's Promise is a 2013 documentary film about the nuclear power debate, directed by Robert Stone. Its central argument is that nuclear power, which still faces historical opposition from environmentalists, is a relatively safe and clean energy source which can help mitigate the serious problem of anthropogenic global warming. The title is derived from the ancient Greek myth of Pandora ...

How have nuclear issues been covered in documentary since the end of the Cold War? This original new book explores how the sometimes elusive, sometimes dramatic effects of uranium products on the landscape, on architecture, and on social organisation continue to show up on screen, maintaining a record of moving images that goes back to the early twentieth century. It is the first book to analyse independent documentary films about nuclear energy - it suggests an approach to documentary films as agents of change. Each chapter of this book focuses on one of ten different documentary films made in Europe and North America since 1989. Each of these films works the material and the ideological heritage of the nuclear power industry into visions of the future. Dealing with the legacy of how ignorance and neglect led to accidents and failures the films offer different ways of understanding and moving on from the past. The documentary form itself can be understood as a collective means for the discovery of creative solutions and the communication of new narratives. In the case of these films the concepts of radioactivity and deep time in particular are used to bring together narrative and formal aesthetics in the process of reimagining the relationships between people and their environments. Focussing on the representation of radioactive spaces in documentary and experimental art films, the study shows how moving images do more than communicate the risks and opportunities, and the tumultuous history, associated with atomic energy. They embody the effects of Cold War technologies as they persist into the present, acting as a reminder that the story is not over yet. Primary readership will be academics and students working in environmental communication and in environmental humanities more broadly. For students of independent film or documentary it will also provide a clear picture of contemporary themes and creative practice.

What starts out as a typical family vacation to Grandma and Grandpa's house quickly erupts into supernatural mystery and peril when three siblings accidentally break an old, mystical jar hidden deep in the woods, revealing they are descendants of Pandora and their family has been tasked for generations with protecting the very jar they just broke... As magical monsters pour out of the fractured relic and run amok, Charlie, Janet, and Trevor must find a way to capture all of the creatures in order to save their family—and potentially the entire world—before it's too late. Writer Kara Leopard ([Super]Natural Attraction) and illustrators Kelly & Nichole Matthews (Jim Henson's Power of the Dark Crystal) weave an otherworldly tale about finding help in the unlikeliest of places, learning the truth about your family history, and most importantly of all, talking cats.

What happens when ideas presented as science lead us in the wrong direction? History is filled with brilliant ideas that gave rise to disaster, and this book explores the most fascinating—and significant—missteps: from opium's heyday as the pain reliever of choice to recognition of opioids as a major cause of death in the U.S.; from the rise of trans fats as the golden ingredient for tastier, cheaper food to the heart disease epidemic that followed; and from the cries to ban DDT for the sake of the environment to an epidemic-level rise in world malaria. These are today's sins of science—as deplorable as mistaken past ideas about advocating racial purity or using lobotomies as a cure for mental illness. These unwitting errors add up to seven lessons both cautionary and profound, narrated by renowned author and speaker Paul A. Offit. Offit uses these lessons to investigate how we can separate good science from bad, using some of today's most controversial creations—e-cigarettes, GMOs, drug treatments for ADHD—as case studies. For every "Aha!" moment that should have been an "Oh no," this book is an engrossing account of how science has been misused disastrously—and how we can learn to use its power for good.

The dangers of organochlorides and a proposed solution.

An informed look at the myths and fears surrounding nuclear energy, and a practical, politically realistic solution to global warming and our energy needs. Faced by the world's oil shortages and curious about alternative energy sources, Gwyneth Cravens skeptically sets out to find the truth about nuclear energy. Her conclusion: it is a totally viable and practical solution to global warming. In the end, we see that if we are to care for subsequent generations, embracing nuclear energy is an ethical imperative.
